OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Migration	Anadromous
<u>coho</u>	<u>10/24/95</u>		<u>X</u>		<u>yes</u>
<u>cutthroat</u>	<u>"</u>		<u>X</u>		<u>?</u>
<u>Dolly Varden</u>	<u>"</u>		<u>X</u>		<u>?</u>
<u>pink</u>	<u>"</u>	<u>X</u>			<u>yes</u>

**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as any other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: 6 baited minnow traps set immediately below Beaver Lake, during Forest Practices Inspection. See attached report. 99 cutthroat trout, 1 Dolly Varden and 5 coho salmon were captured. Pink car-cases were observed approximately 300 yards upstream from the Gokachin Creek confluence.

SUBJECT: Forest Practices Inspection -- Ketchikan Pulp Corporation (KPC) -- Goo Goo MC

---

On October 24, 1995, R.A. Madden (KPC), John Karoly (DOF) and I conducted a Forest Practices Inspection on the KPC Goo Goo MC unit, located on the west side of Thorne Arm. My primary goal was to establish whether the Beaver Lake Fork of Gokachin Creek #101-43-10410, is an anadromous waterway. The results of our stream classification efforts are as follows:

The Beaver Lake outlet is controlled by a series of about eight beaver dams. These well-established dams, appear to have been in place for quite some time and evidence of recent beaver activity is present. A small channel that flows through a wet muskeg and flooded grassy area characterizes this section of the Beaver Lake Fork. Each dam has less than a three foot elevation drop. This section is approximately 300 yards long. There appears to be excellent rearing habitat, but the only spawning gravel is located near a few small side streams that flow into this dammed area. The final dam is at the entrance of a steep sided gorge, a Type B waterway, that continues for approximately 300 yards. After emerging from this Type B gorge, the Beaver Lake Fork becomes a Type A stream again for approximately another 300 yards, before the confluence with Gokachin Creek. This section is five to ten feet in width, there is a 2 to 4 percent gradient with a coarse gravel and cobble substrate.

Six minnow traps were placed in the Beaver Lake Fork, between the Beaver Lake outlet to just below the forth dam from the lake. A total of 99 cutthroat trout, one Dolly Varden, two sticklebacks and five coho salmon were captured. The first coho caught was below the first Beaver Lake outlet dam. Pink salmon carcasses were observed in the lower Type A stream bed, up to the entrance of the Type B gorge. KPC will need to flag a riparian buffer where their Goo Goo MC unit comes within 66 feet of the Beaver Lake Fork near Beaver Lake.

While awaiting our pick up, we hiked approximately 300 yards up uncatalogued Sea Level Creek. This is a major tributary of Gokachin Creek, coming in from the south. This creek is approximately 50 feet wide, has less than a two percent gradient and has a gravel and cobble substrate. Even with high water there were abundant pink carcasses present. Undoubtedly anadromous species utilize a much greater portion of this stream than we had time to document.

Thank you for arranging this inspection and we also appreciate the cooperation of KPC staff for helping to conduct this inspection on a less than perfect day.
